

Thinking Strategies for Subtraction Facts

	Strategy descriptions	Examples
Removal/Counting back	<p>Removal - Decompose numbers into easy-to-remove parts by keeping the “whole” intact and decompose the “part”</p> <p>You can use your counting skills to find the difference between numbers. Count backwards from the largest number is efficient when the numbers in the problem are close together.</p> <ul style="list-style-type: none"> Number lines conceptualize and scaffold student thinking. 	<p>$8 - 4 =$</p> <p>Think: There are two 2s in the number 4, so I am going to take away 2 from 8 first and that’s 6, then take away 2 more and that’s 4. So $8-4=4$.</p> <p>Think: <i>8 is larger, so I’ll start there and count back 4 numbers. Say “8” (catch it, put it in your head...) 7, 6, 5, 4. So, $8-4=4$.</i></p>
Counting up/Adding up	<p>Count up to subtract when the two numbers are close to each other. Count up from the number you subtract (the smaller number).</p> <ul style="list-style-type: none"> Number lines conceptualize and scaffold student thinking. 	<p>$6 - 4 =$</p> <p>Think: <i>I can count up from 4 until I get to 6. Say “4” (catch it, put it in your head...) 5, 6. How many numbers did you count until you got to 6; that’s the answer.</i></p>
Think Addition	<p>Think about addition to subtract.</p>	<p>$8 - 3 =$</p> <p>Think: <i>What can I add to 3 to get to 8? ($3 + \underline{\quad} = 8$) I know that $3 + 5$ is 8, so the answer is 5.</i></p>
Zero (Property of Zero)	<p>When you subtract zero from a number, the difference is that same number.</p> <p>When you subtract a number from itself, the difference is zero.</p>	<p>$3 - 0 =$</p> <p>Think: <i>I don’t have to take anything away from 3, so the difference is 3.</i></p> <p>$3 - 3 =$</p> <p>Think: <i>3 things. 3 things are taken away, so nothing is left.</i></p>
One less/Two less (-1/-2)	<p>When you subtract 1 or 2 from a number, it’s like counting back.</p> <ul style="list-style-type: none"> Number lines conceptualize and scaffold student thinking. 	<p>$7 - 1 =$</p> <p>Think: <i>What is one less than 7? 1 less is 6.</i></p> <p>$7 - 2 =$</p> <p>Think: <i>What is two less than 7? 2 less is 5.</i></p>
Relationship between addition and subtraction (fact families)	<p>Knowing a related addition fact can help you subtract. Numbers always go together!</p> <ul style="list-style-type: none"> Triangular flash cards scaffold student thinking. Part/part/whole models 	<p>$9 - 4 =$</p> <p>Think: <i>I already know $4+5$ is 9. Because I know that, I know the difference is 5.</i></p>
Use Doubles/Doubles +1 to subtract	<p>If you know the addition doubles facts, then you also know the related subtraction doubles.</p> <ul style="list-style-type: none"> The Doubles Rap, with picture cues/visuals, conceptualizes and scaffolds student thinking. 	<p>$14 - 7 =$</p> <p>Think: <i>I know 7 and 7 is 14, so the difference is 7.</i></p> <p>$13 - 7 =$</p> <p>Think: <i>I know 7 and 6 is 13, so the difference is 6.</i></p>
Use Tens to subtract	<p>Sums for ten can help us learn subtraction facts.</p> <ul style="list-style-type: none"> A tens anchor chart can serve as a constant reference for students. 	<p>$10 - 7 =$</p> <p>Think: <i>Ten frame...I know that on a 7 ten frame card there are 3 empty boxes, so 7 and 3 is 10.</i></p>
Decompose to a ten	<p>Decompose the “part” (subtrahend) and remove it from the “whole” (minuend) to make ($15-7$; $7=5+2$ so $15-5=10-2=8$)</p> <ul style="list-style-type: none"> A number line can conceptualize and scaffold student thinking. 	<p>$16 - 9 =$</p> <p>Think: <i>I can decompose 9 into a 6 and 3. I can take 6 away from 16 to make it a 10 and then take away the remaining 3 which is 7. So, $16-9=7$.</i></p>
